Scatter plot showing monthly precipitation (mm) for the period 1979-2019. The x-axis represents months (Jul, Oct, etc.), and the y-axis represents precipitation in mm (0 to 100). The data shows a significant spike in precipitation in June (around 95 mm) and generally low precipitation (below 10 mm) for most other months.

The scatter plot displays the ratio of the number of nodes to the number of edges for the Erdős-Rényi graph. The y-axis represents this ratio, ranging from 0.4900 to 0.5000. The x-axis represents time, with labels for July and October. The data points are clustered at two distinct values: 0.5000 and 0.4900. From July to September, the ratio is consistently 0.5000. From October to December, the ratio drops to 0.4900.

Month	Ratio (Nodes/Edges)
July	0.5000
August	0.5000
September	0.5000
October	0.4900
November	0.4900
December	0.4900

Scatter plot showing the number of days with precipitation per month for 1997. The y-axis represents the number of days (0.80 to 0.86). The x-axis shows months (Jul, Oct). Data points are clustered around 0.83 for July and 0.80 for October, with a notable outlier at 0.86 in late October.
